

Professor of Paediatrics Adam Finn

01-07-2020

Bristol University Hospital

Bristol

This is my reasonable request today 01 July 2020

This is an open letter to all named and to all members of the research team involved in the research and testing of covid19 testing on children. Including putting all on notice, especially Professor Adan Finn of Bristol University Hospital who I believe is in full possession of the facts presented today and has a duty of care not to harm anyone if he knows the dangers.

I would remind people of the threat I face from Boris Johnsons government for being here today to protest and voice my objections to covid19 vaccines **being tested on children that have failed on animals.**

I am fully aware of these unlawful threats to my freedom and willing to be judged under common law to defend my right to free speech and objections to tyranny.

Here are just some of the laws that threaten more of our human rights and freedoms

Forced detention and isolation can affect anyone, including children, and for any amount of time.

Powers last up to 2 years

Lockdown powers could prevent protests 'against measures'.

Protections from forced detainment and treatment under Mental Health Act, lowered.

Cremations can be enforced against personal and religious wishes.

Changes to the court system. And to registration of deaths.

No inquests into suspicious deaths! No requirement for any medical certification for burials or cremations!

It also indemnifies the health service should they fail for whatever reason to provide care. (Meaning they cannot be sued)

Local Authorities will now be exempted from compliance with their duties under The Care Act 2014. Schedule 12.

Our children are now less safe under Boris Johnson

Over 50 safeguarding protection regulations for children have been lifted

My name is Gayzer Frackman. I am here today as a parent with the aim of protecting our children from a government who are lying to us all. The so-called “expert” advice being given us by government doctors and scientists has now been exposed and leaves no excuse whatsoever to unethically test vaccines on children which have failed on animals. Three weeks ago I was horrified to learn that doctors would authorise this and parents could be so caught up in the fear of mass hysteria generated by our now discredited main stream media that some would willingly sign up their children to take part. This begs the question: if all parents decide to protect their children and shun the trials, where would Boris Johnson’s government doctors and researchers find the most vulnerable children? All children should be protected from harm and I call on every parent to do just that.

From my limited research I was appalled to learn that this abuse has gone on for decades from under Tony Blair’s government through to today’s monsters.

What happened to pride in Britain when we had an NHS and health service we could trust?

This government are now guilty of intentionally causing unnecessary pain and suffering to its citizens in order to pander to Bill Gates and Big Pharma. It is time for criminal charges to be brought against all those who are guilty of complicity in the crushing of our economy and our NHS.

I truly believe some of the doctors and scientists caught up in this are simply too scared to speak out but thank God we have some who have been brave enough to educate us.

Today I would like to give an opportunity for Adam Finn, Professor of Paediatrics at the University of Bristol to speak to me. He is an expert in his field and I would like to know if Bristol University are involved with testing these vaccines on children when evidence shows that children are virtually immune to Covid-19.

We now have experts who are questioning the ethics and reality of what is going on. This leads me to the most horrifying question of all and that is are these vaccines intended to alter a child or an adults DNA?

To intentionally alter a child’s DNA would go against all things holy and most definitely would be against the Hippocratic Oath. This is criminal and I put all who are involved, on notice that I will seek legal action against them and their estate and seek the full weight of the law to protect and compensate any child that is injured by any research carried out now that you are aware of the dangers. Every citizen of this country if they are aware of the dangers has a duty of care not to do anything that would harm their neighbour.. I also invoke the precautionary principle.

Evidence I have found to support my concerns

Genetic Engineering Could Make a COVID-19 Vaccine in Months Rather Than Years

Candidates are speeding toward human trials

By Charles Schmidt on June 1, 2020

To quickly create potential vaccines against COVID-19, researchers are using genetic engineering rather than traditional methods, which can take years.

Three different techniques based on **DNA and RNA** molecules are speeding to human trials, **but whether they will work**, or can be scaled up to millions of doses, **is unclear**.

Extracts from the same article

On January 10, when Chinese researchers published the genome of a mysterious, fast-spreading, virus, it confirmed Dan Barouch's greatest worry.

"I realized immediately that no one would be immune to it," says Barouch, director of virology and vaccine research at Beth Israel Deaconess Medical Centre in Boston.

The labs predicted that a commercial vaccine could be available for emergency or compassionate use by early 2021—incredibly fast, given that vaccines to brand-new pathogens have taken a decade to be perfected and deployed. Even the **Ebola** vaccine, which was **fast-tracked**, took five years to reach widespread trials. If Barouch and his counterparts can offer a safe, effective concoction in a year, **"it will be the fastest vaccine development in history,"** he says

That is a big "if," however. Although labs have created several gene-based vaccines for other viruses, **not one** has been **commercialized for a human illness.**

Reality check

The fear generated by the main stream media featuring film footage from China of people crumbling to the ground in mid-step as they walked along streets, and the doors to flats being welded shut, imprisoning those inside to contain this deadly virus. Yet they allowed the airports stay open for weeks with no quarantine. Add to this that there is no footage of anyone dying in such a dramatic manner outside of China.

During the early phase of the epidemic in Europe, adult travellers played a dominant role in seeding infections, which also meant, purely for circumstantial reasons, that children would have played a less significant role in spreading infections.

This is part of an article by Hannah Devlin with the headline.

Are children less susceptible to coronavirus?

Wed 13 May 2020

As countries look to ease school and play restrictions, what evidence is there that children react differently

How many children are being infected with Covid-19?

Children represent just a small fraction of confirmed Covid-19 cases, with fewer than 2% of reported infections in China, Italy and the United States being in people under 18 years old and with under-18s accounted for fewer than 2% of hospital admissions with Covid-19 in the UK.

Does this mean children are less susceptible?

There is now a wealth of evidence that children generally experience milder symptoms when they are infected – although there have been rare cases of children becoming seriously ill or even dying

An old but wise 'If it's not broken why fix it?' unless there is a more sinister agenda here?

Why do children react differently to adults?

For many infectious diseases, there is a U-shaped risk curve, with the youngest and oldest in society being most vulnerable. Covid-19 does not follow this pattern – even toddlers and newborn babies typically only experience mild symptoms. One theory is that children's lungs might contain fewer of the ACE2 receptors that the virus uses to enter cells. To confirm this, researchers would need to

study tissue samples from children. Another possibility is that children's immune systems respond in a more optimal way to the virus – mounting a strong enough response to get rid of the infection, but without going into overdrive and flooding the body with inflammatory proteins, which are known to sometimes cause problems in adult patients

Are children invisible transmitters? Well big pharma do need an excuse to test them now don't they, which perfectly demonstrates who has the power over government and our NHS.

I would like to quote a doctor who questioned the government's handling of vaccinations of children twenty years ago.

Doctor Fox added: 'Immunisation is about a balance of risks. Although the balance is almost always in favour of immunisation, without information parents cannot be expected to make an informed decision.'

That doctor was Shadow Health Secretary Liam Fox who twenty years ago called on the Labour Government to launch an inquiry into meningitis C immunisation, which was rushed in because of an expected rise in cases over the winter. 'If information has been withheld, it will lead to suspicions that officials have not been entirely frank. If 11 deaths have not been made public, the Government risks the public losing faith in the system. This is woefully incompetent.'

Shadow Health Secretary Liam Fox last night called on the Government to launch an inquiry into meningitis C immunisation, which was rushed in because of an expected rise in cases over the winter. 'If information has been withheld, it will lead to suspicions that officials have not been entirely frank. **If 11 deaths have not been made public**, the Government risks the public losing faith in the system. **This is woefully incompetent.**'

Let me remind you of the numbers and how disproportionate (like today) the response was to a very small risk to the population.

It's estimated that there are over 64 million people in Britain and out of those 'each year' around **1,500 people contract meningitis C**, with about **150 fatalities**. The Government has said the programme had reduced cases by 70 per cent since it was introduced last year. So far 13 million babies, children and adults have been immunised.

This is not about keeping our children safe. No this is about big pharma exploiting a devastating disease that threatens a very small amount of people that can be successfully treated if caught in time. So this is pure exploitation of our children for profit and it is now time for any person or company who have been part of this crime to be investigated and prosecuted.

Let me remind those parents that probably didn't know or more than likely forgot the devastating effects of unnecessary vaccines.

Extracts from an articles in the Guardian, August 2000

The Government was last night **accused of a cover-up over the safety of its mass meningitis immunisation programme** after The Observer obtained confidential documents that show at least 11 people have died after injections to prevent the disease.

Although doctors have reported the deaths as part of routine monitoring of effects of the vaccine to the Medicines Control Agency (MCA), the Government has not published the figures and last night insisted the programme was safe.

Documents from the MCA obtained by The Observer show that since the immunisation programme began last year there have been **more than 16,000 adverse reactions reported** by GPs under the so-called Yellow Card system. The Department of Health estimates only 10-15 per cent of reactions are reported under the scheme so **the real figure is likely to be far higher**

Britain is the first European country to introduce the vaccine. Although GPs have been told it cannot induce symptoms of meningitis, two of the deaths after vaccination have been attributed to 'septicaemia meningococcal', the infection of the blood that results from the disease.

Isabella Thomas, of vaccination support group Jab's (Justice Awareness Basic Support), said she had had reports of children having fits after being given the vaccine: 'I am not convinced by government reassurances. We are receiving daily calls from parents whose children have had serious reactions. We believe the Government introduced it far too quickly.'

Dr Jayne Donegan, a London GP who has seen an increase in reactions among children at her surgery, spoke of a campaign, encouraged by the Government, to brand people who do not have their children vaccinated as irresponsible. 'This is not necessarily true, especially with something as untried as the meningitis C vaccine.'

Adam Finn, a paediatric expert at Sheffield Children's Hospital who is carrying out trials of the vaccine, said he believed the drug was safe, although it had induced extreme reactions in some children. 'We don't want children having fits as a result of a drug that hasn't been properly tested,

He said the normal trials on a new vaccine were not possible in Britain because of the relatively small numbers of people who contracted the disease. Instead scientists had tested whether the vaccine produced sufficient antibodies.

He said the Government had a duty to give the public all relevant information about the drug: 'The public has sufficient intelligence to make the decision for themselves. The way to get them to accept it is to tell the whole story.'

Evidence of real lives and families devastated and government cover ups that are both real and unacceptable, and proves the biggest dangers in our schools of education. They should not be experimental centres for big pharma profit.

Headline from the guardian August 2000

Hell of families hit by 'cover-up' (extracts)

One boy died and the life of another lay in ruins after meningitis C vaccinations, but medical and schools chiefs defend current policy.

When Christopher Robb collapsed on the stairs of Dunfermline High School at 1.30pm on 17 December 1999, his world collapsed with him. He had been feeling strange for two hours since being given the vaccine for the meningitis C virus.

'The next thing I remember was waking up in hospital later that afternoon with needles and equipment sticking out of me,' says Robb, now 17

Staff at Queen Margaret Hospital in the Fife town, suspecting meningitis itself, gave Robb a brain scan and attempted a lumbar puncture for diagnostic purposes. He was discharged the next day, but collapsed again and was readmitted to be kept under observation for three days. His life has not been the same since. He made a slow recovery and his schoolwork suffered as a result. After Christmas he fell into a suicidal depression that his family is convinced was caused by the trauma of the reaction to the vaccine.

Robb has just heard that he did not get the exam grades he needed to get to the university of his choice.

His mother Una said: 'We have no idea what went on in his brain that day. We just feel there must be a connection to the jab. He was a young man with everything to look forward to. **This has affected his whole life.**'

Robb has now recovered from the effects of the vaccine and will soon come off medication he has been taking for depression. He hopes to retake his Scottish Higher exams next year and study sports science at Edinburgh or Stirling universities. But it remains mystifying that a fit young man with no history of fits or fainting, who played rugby and football for his school, should have been affected in such a devastating way by a simple vaccine.

Robb's is one of 11,000 cases reported by GPs across the country in which the new meningitis vaccine has caused adverse reactions. The vast majority are relatively minor, involving the usual headaches, rashes and dizziness associated with vaccination jabs. But some are far more serious, and have resulted in hospital treatment and even death, say doctors.

Una Robb was told that there were no other cases similar to Christopher's. **She was instructed not to talk to the media when she rang the Meningitis Trust's helpline for advice.** 'It has never been disputed that this was a reaction to the vaccine, but the school doctor insisted it was an isolated case,' she told The Observer.

The family kept quiet until they heard about the case of another Scottish boy, 14-year-old **Keith MacGregor**, who died last March five days after a meningitis C jab at Inverurie Academy in Aberdeenshire. **MacGregor** was taken ill while playing a Saturday football match. He died the following morning.

'The whole thing has been covered up,' says Mrs Robb. 'That's what really annoys me. I read about the boy from Inverurie and thought "that could have been me".'

She is now furious that she was told to keep quiet about his case: 'We kept asking them to make it public, to make sure people were careful. But they kept telling us not to talk to the media.'

The small northern Scottish town of Inverurie has been devastated by **Keith MacGregor's** death, although health officials immediately reassured the family that the death was not connected to the inoculation. A letter sent by Dr Jon Cresswell, consultant in public health medicine at Grampian Health Board, to all parents at the time said: 'Although your child may have had menC

vaccine recently, I want to reassure you that [Keith MacGregor's death] is not related to the vaccine, which is very effective in preventing meningitis C.'

MacGregor's father was told his son's life might have been saved if he had had the injection earlier.

Graham Richie, acting head of the academy at the time **the boy** died, said the letter had reassured parents and teachers, who had felt responsible. The school will make a statement about the possible link to the vaccine this week, after talks with the MacGregor family.

There are also serious concerns for young babies who are now vaccinated against meningitis C, when they receive their other jabs at the ages of two, three and four months. **Of the 11 deaths reported to the Medicines Control Agency, six involved sudden infant death syndrome, and GPs are reporting thousands of cases of reactions among babies.**

One north London couple said they wanted The Observer to tell the story of their son, who nearly died after a meningitis jab earlier this month. They have chosen to remain anonymous because of their need to maintain good relations with their hospital and GP.

The baby, 'Ralph', developed a high temperature and started vomiting after **his third meningitis jab**. He was taken to the Royal Free Hospital in Hampstead. As happened in the case of Christopher Robb, staff immediately treated it as a case of meningitis, although they said 'Ralph' couldn't have developed this from the drug. His parents were told he could die if doctors couldn't get his temperature down.

Eventually, after administering heavy doses of antibiotics overnight, his temperature returned to normal. Again the family were told this was an isolated case. Their GP told them **Ralph had 'a slight reaction'.**

'We kept asking for information,' the mother said last night. **'But they wouldn't tell us what was happening. We were told the vaccine was safe,** but I couldn't believe the seriousness of it.'

Her husband is now convinced babies are given too many vaccinations at the same time. 'It would be extremely unlikely that our son developed meningitis on exactly the same day as the injection,' he said. 'I am a great believer in vaccination programmes, but there must be better ways of doing it. **It is devastating to watch your child dying.**'

Final word from our governments sponsors

Mene Pangalos, Executive Vice President, BioPharmaceuticals R&D, AstraZeneca said: 'We are so proud to be collaborating with the University of Oxford to accelerate the development and globalisation of this potential new vaccine against COVID-19 infection. The speed at which this new vaccine has advanced into late-stage clinical trials is testament to Oxford's ground-breaking scientific research. We will do everything in our power to engage with governments, multilateral organisations and partners around the world to increase production and distribution and ensure rapid, fair and equitable distribution of a globally accessible vaccine.'

This study aims to assess how well people across a broad range of ages could be protected from COVID-19 with this new vaccine called ChAdOx1 nCoV-19. It will also provide valuable information on safety aspects of the vaccine and its ability **to generate good immune responses against the virus.**

Children are not guinea pigs and have a robust immune system especially against Covid-19, so hands of our children they are not for sale at any price. Parents are now aware and you now have a fight on your hands. I believe the government will now have to face parents who are not divided by social scale, politics, race or religion but protective of all children and now they know Boris Johnsons government are about to be pressured in a way they never imagined in their plans to break Britain.

Our children should be going to school for an academic education to learn the basics and expand at their own pace in a safe environment, not to be experimented on or have sex education from the age of four.

Bill Gates and his World Health Organisation has way to much influence over the lives of our sovereign state and our elected leaders. With his billions wielding too much control on both sides of Westminster with our lives without our consent.

I am bringing parent power to Downing Street the seat of power that Boris Johnson has now made irrelevant when ignoring requests for inquiries, ignoring the courts and lying to the queen.

Our nation is now vulnerable to the powers of China and the elite who own our banks and media because they paved the way for their politicians to control Westminster to do their bidding.

It is now time to protect our children from greed and corruption and find our faith and belief in ourselves to be the owners of our own destiny, if we do not do it now our children will be slaves.

I put all named on notice and will seek legal action for those harmed by their actions and will seek justice and compensation from them personally and their estate as a free man under common law.
